

Forklift Fork Positioners

Forklift Fork Positioner - The fork positioner is a hydraulic apparatus that could allow the driver to control the lift truck without leaving the seat. They are made out of high quality materials and are intended to withstand the most demanding operations and work environments. Side shifting models have the extra ability to be able to laterally position the arms or the entire load in order to facilitate more precise lifting and position in a faster and more effective way.

The blade pocket is quite unique and can enable the one operating it to safely sway the forks into position without any worry of destroying the positioning cylinders. This could allow the operator the alternative to perform simultaneous or independent fork movement, dependent upon the requirements of the job. For most forklifts with non-OEM carriages, complete carriages are necessary. Standard OEM carriages could be converted into fork positioners on existing units.
